## What is D/MARC?

**D/MARC** is Corporation Pop's latest product offering and allows companies to securely access remote Internet data services through a restricted corporate firewall.

Corporation Pop have carried out a number of initial security audits at several blue chip enterprise client sites with 100% success in compatibility with existing Internet infrastructure. Applications for **D/MARC** included all industries where a restrictive corporate firewall is in place on the corporate network which by design restricts access to services that would otherwise be safe for users to access.

## Features & benefits

**D/MARC** allows organisations to securely access any remote Internet service through a restricted corporate firewall.

Access is metered and can be limited to a single service or multiple services can be selected.

All data is encrypted and transferred using SSL. Local points of presence ensure high speed data transfer.

**D/MARC** consists of three core components:

- A client application which allows encrypted traffic to be delivered outside the corporate firewall to Corporation Pop's remote **D/MARC** service.
- A remote service allowing metered access to specified Internet services.
- A Software Development Kit (SDK) allowing developers to embed Corporation Pop's **D/MARC** technology into their applications.

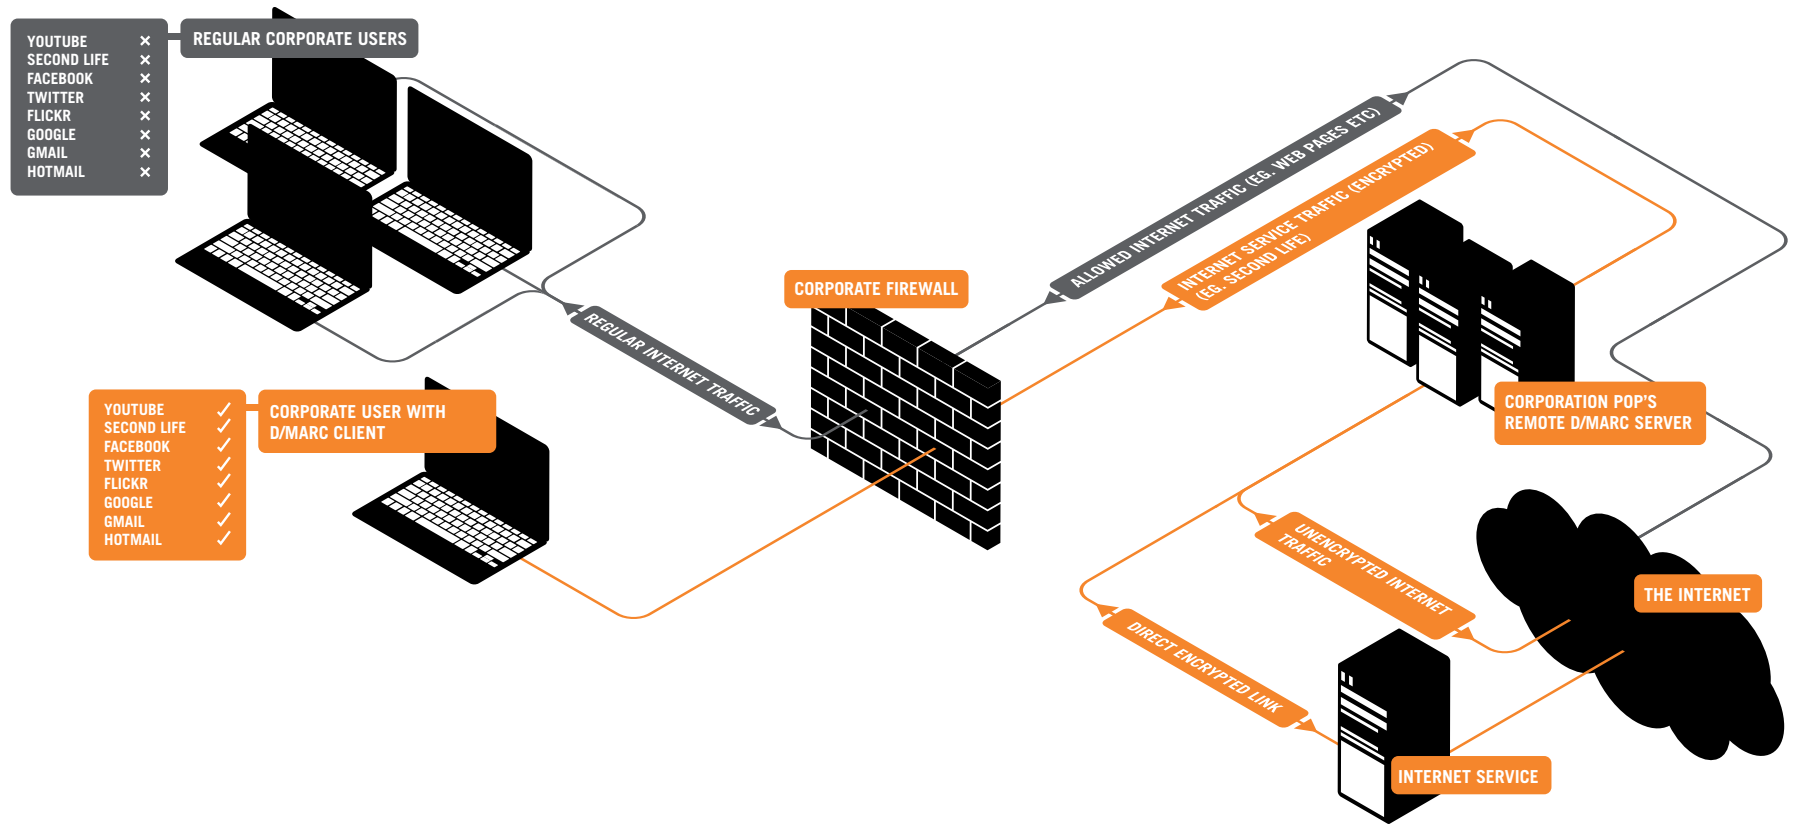

**D/MARC** allows businesses to:

- Access safe Internet services that unfortunately by design would normally be filtered by the corporate firewall.
- Create end-to-end encrypted connections to Internet services.
- Delegate named staff access to Internet services that would otherwise be filtered by the corporate firewall.
- Allows System Administrators to fine tune what content can be accessed by named end users.
